16. Abstract This is the Methodology Report for the 1998 Motor Vehicle Occupant Safety Survey. The survey is conducted on a biennial basis (initiated in 1994), and is administered by telephone to a randomly selected national sample. Two questionnaires are used, each administered to approximately 4,000 respondents aged 16 and older. The survey collects information concerning attitudes, knowledge, and behavior in different occupant protection and highway safety areas. These include seat belts, child safety seats, air bags, (bicyclist and motorcyclist) helmet use, Emergency Medical Services, and crash injury experiences. The field period for the survey was from November 5, 1998 to January 12, 1999.			
This document describes the methodology used to conduct the survey. It also contains copies of both the English and Spanish language versions of the questionnaires. NHTSA will issue a series of reports during 1999 and 2000 summarizing results from the survey.

Sample Design

The 1998 Motor Vehicle Occupant Safety Survey, like both the baseline Motor Vehicle Occupant Safety Survey in 1994 and its follow-up survey of 1996, was conducted by telephone. Hence, the study procedures called for the construction of a national sampling frame of telephone households from which a random population sample could be derived. For each of the two survey instruments (one focusing on safety belts and the other on car seats, with a common core of questions relating to personal characteristics and driving behaviors), a national probability sample was developed. Each sample was composed of approximately 4,000 persons age 16 and older, including oversamples of persons age 16-39. Since the sampling procedures and data collection methodology for the two samples were identical, procedures described in this report for one sample apply to the other as well.

The procedure for developing a population-based sample for this telephone survey involved four stages. The first stage sample involved a population-based sample allocation, distributed in proportion to the geographic distribution of the target population according to the most recent Census estimates. The second stage employed a systematic selection of assigned telephone banks within the geographically stratified first stage sample design. The third stage in the sampling procedure was to conduct a random digit dialing (RDD) sampling of telephone households within the telephone banks selected in the second stage. The fourth stage required the identification and systematic selection of one eligible respondent within each sampled household so that the household sampling frame yielded a population sample of the eligible population. These procedures yielded national estimates of the target population, within specified limits of expected sampling variability, from which valid generalizations can be made to the general public.

Sample Construction

Most of the statistical formulas associated with sampling theories are based upon the assumption of simple random sampling. Specifically, the statistical formulas for specifying the sampling precision (estimates of sampling variance), given particular sample sizes, are premised on simple random sampling. Unfortunately, random sampling requires that all of the elements in the population have an equal chance of being selected. Since no enumeration of the total population of the United States (or its subdivisions) is available, all surveys of the general public are based upon an approximation of the actual population and survey samples are generated by a process closely resembling true random sampling.

The survey sample was based on a modified stratified random digit dialing method, using an area probability/RDD sample rather than a single-stage/RDD sample. There are several important advantages to using an area probability base: (1) it draws the sample proportionate to the geographic distribution of the target population rather than the geographic distribution of telephone households, which is vital to constructing unbiased population estimates from telephone surveys; (2) it allows greater geographic stratification of the sample to control for known geographic differences in non-response rates; and (3) it facilitates the use of Census estimates of population characteristics to weight the completed sample to correct for other forms of sampling bias. Moreover, the precision of sample estimates is generally improved by stratification.

Hence, as specified for the study design for the survey, the adult household population of the United States was stratified by the ten NHTSA regions. The estimated distribution of the population by stratum was calculated on the basis of the Bureau of the Census, Resident Population of the United States, Regions and States by Selected Age Groups and Sex: April 1, 1990 Census and July 1, 1995 to July 1, 2050 Estimates (release date, February 1998). At the time of the survey, these were the most recent projections of the distribution of adult population by state. Based on these Census data on the geographic distribution of the target population, the total sample was proportionately allocated by stratum. The geographic allocation of the cross-sectional sample for the survey is presented in Table 1.

TABLE 1
Population Aged 16 and Older by NHTSA Region:
February, 1998

		Population	Cross-Section Proportion	Sample (3,000)
		207,594,256	100.00%	
Region I	CT, ME, MA, NH, RI, VT	10,565,351	5.09	153
Region II	NJ, NY	20,321,261	9.79	294
Region III	DE, DC, MD, PA, VA, WV	21,443,106	10.33	310
Region IV	AL, FL, GA, KY, MS, NC, SC, TN	39,268,081	18.92	567
Region V	IL, IN, MI, MN, OH, WS	37,650,887	18.14	544
Region VI	AR, LA, NM, OK, TX	23,792,984	11.46	344
Region VII	IA, KS, MO, NE	9,780,660	4.71	141
Region VIII	CO, MT, ND, SD, UT, WY	6,771,875	3.26	98
Region IX	AZ, CA, HI, NV	29,589,196	14.25	428
Region X	AK, ID, OR, WA	8,410,855	4.05	122

Source: Resident Population of the United States, Regions and States by Selected Age Groups and Sex: April 1, 1990 Census and July 1, 1995 to July 1, 2050 Estimates, U.S. Bureau of the Census, (release date, February 1998).

Once the sample had been geographically stratified with sample allocation proportionate to population distribution, a sample of assigned telephone banks were randomly selected from an enumeration of the Working Residential Hundreds Blocks of the active telephone exchanges within the region. The Working Hundreds Blocks were defined as each block of 100 potential telephone numbers within an exchange that included 3 or more residential listings. (Exchanges with one or two listings were excluded because in most cases such listings represent errors in the published listings).

The use of residential listings to identify working residential exchanges is generally described as "listed assisted" or "truncated" RDD sampling. In a series of empirical studies, Brick, et. al. demonstrated that only about four percent of all telephone households are excluded in national samples using this method. In addition, these studies indicate that the differences between covered and uncovered samples are trivial in most instances. The principal advantage of "list assisted" sampling is that an equal probability systematic sample of telephone numbers can be selected under this procedure and the variances of estimates from the list-assisted sample are usually lower than those from a clustered design like the Mitovsky-Waksberg RDD method.

In the third stage sample, a two digit number was randomly generated by computer for each Working Residential Hundreds Block selected in the second stage sample. This third stage sampling process is the random digit dialing (RDD) component. Every telephone number within the Hundreds Block has an equal probability of selection, regardless of whether it is listed or unlisted.

The third stage RDD sample of telephone numbers was then dialed by SRBI interviewers to determine which were currently working residential household phone numbers. Non-working numbers and non-residential numbers were immediately replaced by other RDD numbers selected within the same stratum in the same fashion as the initial number. Ineligible households (e.g., no adult in the household, language barriers) were also immediately replaced. Non-answering numbers were not replaced until the research protocol (in this study, a five call protocol) was exceeded.

Screening to Determine Household Eligibility

The sample construction process yielded a population-based, random-digit dialing sample of telephone numbers. The systematic dialing of those numbers to obtain a residential contact yielded a random sample of telephone households. The next step was to select eligible households within the total sample of working numbers.

An adult respondent at each number drawn into the sampling frame was contacted about the composition of the household. Telephone numbers that yielded non-residential contacts such as businesses, churches, and college dormitories, were screened out. Only households, i.e., residences at which any number of related individuals or no more than five unrelated persons living together, were eligible for inclusion in the sample. This minimal screening was only to ascertain that the sample of telephone numbers reached by interviewers are residential households.

Selection of Respondent Within Household

The multi-stage sampling process described in the previous sections yielded a random national sample of households with telephones, drawn proportionate to the population distribution. The final stage required the selection of one respondent per household for the interview.

A systematic selection procedure was used to select one designated respondent for each household sampled. The "most recent/next birthday method" was used for within household selection among multiple eligibles. The Within Household Selection Procedure is presented in Figure 1. The CATI system alternated the "most recent" and "next" birthday specification for the selected respondent to avoid a temporal bias for birthdays before (or after) the field period.

REACHES THIS PERSON, THEY WILL ENTER Q.1 AS C1].....3

Young Adult Oversample

The survey design specified an oversample of 16-39 year olds in the achieved sample in order to permit more detailed analysis of this subset of the population. A random sample of all persons age 16 and over in an RDD sample of 4,000 households yields too few individuals in this range to allow very close examination. Therefore, to increase the subsample sizes of the 16-39 year olds, within a projectable national sample, an independent national sample was conducted of that population. The allocation of sample by region for the young adult oversample is proportional to the regional distribution of that population. The household selection procedures through RDD is the same for the oversample as for the national cross-sectional sample.

The screening criteria for the oversample were different from the simple cross-section in that households were screened for persons age 16 to 39. This systematic screening of a national probability sample of households for a subset of the total household population should yield a random sample of that population. As in the case of the simple cross-sectional sample, if there was only one eligible respondent in the household then he or she was selected. If there were more than one eligible respondent, then the "most recent/next birthday" method of selection was used. The oversample screener script is presented in Figure 2.

Bureau of the Census. Middle Series estimates for February, 1998.

Initial Contact

Initial telephone contact was attempted during the hours of the day and days of the week which have the greatest probability of respondent contact. The primary interviewing period was from 5:30 p.m. to 10:00 p.m. on weekdays, from 9:00 a.m. to 10:00 p.m. on Saturdays, and from 10:00 a.m. to 10:00 p.m. on Sundays (all times are local time). Since interviewing was conducted across time zones, the interviewing shift lasted until 1:00 a.m. Eastern Time (10:00 p.m. Pacific Time).

If the interview was not conducted at the time of initial contact, the interview was rescheduled at a time convenient to the respondent. Although initial contact attempts were made on evenings and weekends, daytime interviews were scheduled when necessary. If four telephone contacts on the night and weekend shifts did not elicit a respondent contact, the fifth contact was attempted on a weekday.

Interviewers attempted a minimum of five calls to each telephone number. When the household was reached, the interviewer asked to speak to an adult to screen the household for eligibility and to determine the designated respondent. When the designated respondent was reached but an interview at that time was inconvenient or inappropriate, interviewers set up appointments with respondents. When contact was made with the household, but not the designated respondent(s), interviewers probed for appropriate callback times and attempted to set up an appointment.

Spanish Language Interviews

Spanish language versions of the two survey instruments were developed in order to eliminate language barriers for a small proportion of the U.S. adult population. If the interviewer encountered a language barrier at the telephone number, either with the person answering the phone or with the designated respondent, the interviewer thanked the person and terminated the call. If the case was designated as Spanish language, it was turned over to the next available Spanish-speaking interviewer.

All households in which a language barrier (Spanish) was encountered were assigned to a Spanish-speaking interviewer. These bilingual interviewers recontacted the Spanish-speaking households to screen for eligibility and conduct interviews with eligible respondents.

Refusal Conversion

The process of converting terminations and refusals, once they had occurred, involved the following steps. First, there was a diagnostic period, when refusals and terminates were reported on a daily basis and the Project Director and Operations Manager reviewed them after each shift to see if anything unusual was occurring. Second, after enough time had passed to see a large enough sample of refusals and terminations, the Project Director and his staff developed a refusal conversion script. Third, the refusal conversion effort was fielded with reinterview attempts scheduled about a week after the initial refusal. Fourth, the Project Director and Operations Manager received the outcomes of the refusal conversion efforts on a daily basis. Minor revisions of the script and the procedures were made, as needed. The final refusal conversion script is shown in Figure 3, on the following two pages.

FIGURE 3
Refusal Conversion Script

Hello, my name is _____. I am a field supervisor with SRBI, a national research organization in New York. I believe that someone in your household may have been contacted by one of our interviewers concerning a public policy study that we are conducting for the U.S. Department of Transportation in Washington, D.C.

- Yes, respondent.....1
- Yes, other.....2
- No, don't recall.....3

1. In order to assess the effectiveness of current traffic laws, the U.S. Department of Transportation is conducting a study of Americans' attitudes about current driving laws. It is a public opinion study that will help the government to consider traffic laws in light of what the public really wants and does. It only takes about fifteen minutes and it's strictly confidential.

Willing to proceed.....1 GO TO SELECTION GRID
Refuses.....2

2. I understand. My job as a field supervisor is to find out if there are any problems with our surveys or interviewers that are discouraging people from participating. Could you tell me if we have done something wrong or is there something about the interview that concerns you?

IF: I don't do surveys.
ANSWER: I understand, but this is the first survey to really examine whether our traffic laws are realistic and appropriate in terms of what people really want and really do. The results will be presented to Congress and may affect laws in your state. It is really important.

IF: I don't have time.
ANSWER: It doesn't take very long and we can schedule it at a time convenient to you. We need to represent the opinions of busy people like you, as well as people who have more time, if we are to present an accurate picture to Congress of what the public thinks and wants.

IF: I don't know if you are who you say you are.
ANSWER: I can give you our 800 number to call and confirm the authenticity of the study.

IF: I don't know how the results will be used.
ANSWER: The Department of Transportation has been charged by the Congress to report to them about public opinion and behavior related to traffic laws, in order to assist them in determining whether certain laws should be changed or not. That's why we need to talk to you.

IF: I don't drive.
ANSWER: Then the interview should only take a few minutes. Even if you don't drive, we need to get your opinion about some traffic laws that may affect you as a pedestrian. We also need a little background about non-drivers, but it won't take long at all.

FIGURE 3
Refusal Conversion Script
(continued)

IF: Don't know enough.
ANSWER: This is an opinion survey about driving, traffic safety and traffic laws based on your experience. We need to talk to all kinds of people to get a true picture of what ordinary Americans think, not just what "experts" say.

IF: I don't want the government to know about me/ what I do.
ANSWER: The interview is strictly confidential. Your telephone number was selected at random. As soon as we complete the interview and verify it, we destroy the phone number. No one will ever know who you are. We do this so that you can be comfortable in telling us what you really think, not what you think the government wants to hear.

IF: It's a bad time.
ANSWER: We can schedule a callback for a time that would be good for you.

Date _____ Time _____

IF STILL HESITANT SAY:

It is really important that we represent the views and experience of people like yourself so that the findings will be fair and accurate. You don't often get a chance to participate in studies that may affect the laws in your community. It's really important and we really want to represent your household in the study. If now is a bad time, we can schedule the interview during the day, in the evening, or on the weekend whenever is better for you.

(IF SUGGESTS A TIME MORE THAN TWO WEEKS HENCE:

We are supposed to finish the study by the end of November. Could we find some time this week (or next) to do the interview?)

Date _____ Time _____

IF AGREEABLE, GO TO THE SELECTION GRID.

IF STILL REFUSES, THANK AND COMPLETE.

Field Outcomes

Survey data collection by the Federal government requires prior approval by the Office of Management and Budget (OMB). Before submitting the formal request for data collection to OMB, NHTSA published a Notice in the Federal Register soliciting comments on the information collection. The Notice appeared in the Federal Register, 63:50, pages 12858-12859, March 16, 1998. The closing date for comments was May 15, 1998. No comments were received in response to the Notice. NHTSA then submitted the request for data collection to OMB June 29, 1998. OMB approved the information collection September 9, 1998, assigning it the OMB number 2127-0596 with an expiration date of December 31, 1999.

The field interviewing for the study commenced on November 5, 1998, following training of the field interviewers, and was completed on January 12, 1999. This is approximately the same time period in which the 1996 Occupant Protection Survey (November 4, 1996 to January 5, 1997) and the 1994 Occupant Protection Survey (October 5, 1994-December 11, 1994) were conducted. Status of cases as of the end of the field period are reported using the categories defined below.

FIGURE 4
Sample Disposition Categories

NIS/DIS/change #	The number was not in service, had been disconnected, or yielded a recording indicating that it was no longer an active number
Non-residential	The number yielded a contact with a business, government agency, pay telephone, or other non-residential unit
Computer/fax	The number yielded an electronic tone indicating a fax machine or data line
Pre-screened NIS/DIS	Automated dialer used to pre-screen numbers that are no longer in service or disconnected prior to that number being included in the sample
SSI Business Numbers	Pre-screened phone numbers through Survey Sampling Inc. that pre-identifies a place of business before actual dialing begins.
No answer	The number rang, but no one answered. The protocol required five calls to non-answering numbers.
Busy	A busy signal was encountered
Answering machine	An answering machine was reached at the telephone number
Language	The interview could not be completed because of language barriers
Not Available	
Health/Deaf/Deceased	Those unable to participate due to death, self-defined health reasons, or deafness
Away for duration	The designated respondent was out of the area for the entire field period
Callback	Contact was made with the household, but not necessarily the designated respondent. By the end of the field period, the case had neither yielded a refusal or completed interview
Callback to complete	The interview was interrupted, but not terminated. The field period ended before the full interview could be completed
Refusal -- Initial	Someone in the household refused to participate in the study
Refusal -- Second	During a refusal conversion attempt, a second refusal to participate in the study was encountered
Screen Outs	Households whose eligible participants had met the gender and/or age quotas by Region
Terminate	A respondent began the interview but refused to finish
Complete	An interview was completed with the designated respondent

For survey Version 1 - Seat Belt Usage Issues, a total of 30,620 randomly selected telephone numbers were sampled within a geographically stratified national sampling frame for both sample components (the cross-section of youth and adults age 16 and older and the oversample of persons age 16-39):

- 59% of the numbers were not active residential phone numbers, including 32% Pre-screened NIS/DIS; 10% NIS/DIS/Change#/Wrong# after the number was dialed; 7% SSI Pre-screened Business Numbers; and 3% computer or fax tones;
- 7% of the numbers were no answers (despite repeated attempts) and 2% were answering machines; and
- 2% were households in which the designated respondent was not interviewable (not available; away for an extended period, incapacitated, or deaf) and an additional 1% were non-interviewable due to language barriers (non-Spanish).

At the close of the field period, only 521 cases (2%) were in callback status.

The participation rate represents one of the most critical measures of potential sample bias because it indicates the degree of self-selection by potential respondents into or out of the survey. The participation rate is calculated as the number of completed interviews (including respondents who screen out as ineligible) divided by the combined total number of completed interviews, terminated interviews, and refusals to interview. (The inclusion of screen outs in the numerator and denominator is mathematically equivalent to discounting the refusals by the estimated rate of non-eligibility among refusals.) The participation rate for Version 1 is based on the following elements:

- 4,094 completed interviews;
- 2,436 cases in which someone in the household completed the household screen, but no one in the household was found to be eligible for the full interview (2362 were age-related screen-outs among the age 16-39 oversample); and
- 1,627 refusals to be interviewed (including 1220 second refusals) and 43 terminated interviews.

Based on the standard calculations of participation rate, as defined by the Council of Applied Statistical Research Organizations (CASRO), the participation rate for Version 1 was 79.6%. This formula treats the numerator as all respondents who participate by completing required survey questions, while the denominator includes those who complete required questions, those who begin but terminate before completing all required questions, and those who refuse entirely.

The Final Summary Disposition of the Version 1 sample is given in Table 3. The table includes breakouts for each survey component (national youth and adult cross-section and the age 16-39 oversample). The average interview length for Version 1 was 22.7 minutes.

TABLE 3
Sample Disposition:
Version 1, Seat Belt Usage Issues

	CROSS-SECTION	OVER-SAMPLE	TOTAL
TOTAL NUMBERS DIALED	16891	13729	30620
NIS/Dis/Change#/Wrong#	1794	1331	3125
Non-residential	1137	924	2061
Computer/fax	525	420	945
Prescreened NIS-DIS	5440	4364	9804
SSI Business Numbers	1228	1012	2240
Other Reason Terminating	11	4	15

For survey Version 2 - Child Safety Seat Issues, a total of 29,592 randomly selected telephone numbers were sampled within a geographically stratified national sampling frame for both sample components (the cross-section of youth and adults age 16 and older and the oversample of persons age 16-39):

- 59% of the numbers were not active residential phone numbers, including 31% Pre-screened NIS/DIS; 10% NIS/DIS/Change#/Wrong# after the number was dialed; 8% SSI Pre-screened Business Numbers; and 3% computer or fax tones;
- 6% of the numbers were no answers (despite repeated attempts) and 2% were answering machines; and
- 3% were households in which the designated respondent was not interviewable (not available; away for an extended period, incapacitated, or deaf) and an additional 1% were non-interviewable due to language barriers (non-Spanish).

At the close of the field period, there were 235 cases (1%) in callback status.

The participation rate for Version 2 is based on the following elements:

- 4,121 completed interviews;
- 2,693 cases in which someone in the household completed the household screen, but no one in the household was found to be eligible for the full interview (2,614 were age-related screen-outs among the age 16-39 oversample); and
- 1,538 refusals to be interviewed (including 1024 second refusals) and 40 terminated interviews.

Based on the standard calculations of participation rate, the participation rate for Version 2 was 81.2 percent.

The Final Summary Disposition of the Version 2 sample is given in Table 4, on the next page. The table includes breakouts for each survey component (national youth and adult cross-section and the age 16-39 oversample). The average interview length for Version 2 was 16.3 minutes.

Sample Weighting

The characteristics of a perfectly drawn sample of a population will vary from true population characteristics only within certain limits of sample variability (i.e., sampling error). Unfortunately, social surveys do not permit perfect samples. The sampling frames available to survey research are less than perfect. The absence of perfect cooperation from sampled units means that the completed sample will differ from the drawn sample. In order to correct these known problems of sample bias, the achieved sample is weighted to certain characteristics of the total population. Each of the survey samples was weighted separately.

The weighting plan for the survey was a multi-stage sequential process of weighting the achieved sample to correct for sampling and non-sampling biases in the final sample. The first stage in the sample weighting procedures was designed to correct the cases in the completed sample for known selection biases in the sampling procedures. At the household selection stage, a random digit dialing process will give households with more than one telephone number an unequal likelihood of selection. Nationally, about 18% of households selected by random digit dialing will have more than one telephone number. This selection bias was corrected by giving each household a first stage weight equal to the inverse of the number of different telephone numbers in the household, up to a maximum of three phone numbers..

The second step in the weighting process was to correct for selection procedures that yielded unequal probability of selection within sampled households. Although the survey was designed as a population survey, only one eligible person per household could be interviewed (because multiple interviews per household are burdensome and introduce additional design effects into the survey estimates). A respondent's probability for selection is inverse to the size (number of other eligible adults) of the household. Hence, the second stage weight was equal to the number of eligible respondents within the household.

The next step in the weighting process was to correct the study design for deliberate disproportionate selection of younger population subsets in the sample design. The survey included both a cross-sectional sample of 3,000 respondents, aged 16 and older, and an oversample of 1,000 persons, aged 16 to 39 years old. Hence, the total achieved sample yielded a disproportionate sample distribution by age. A third stage weight was used to correct the achieved sample for disproportionate sampling by dividing the expected population distribution, based on Census projections, by the achieved sample distribution on the stratification variables. Specifically, the third stage weight corrected the sample to the cell distribution of the population for six age cohorts (16-24, 25-34, 35-44, 45-54, 55-64, and 65 or older) by gender, using the Census Population Projections for Age, Sex and Race for 1998. After these corrections were made, no further weighting by other Census characteristics (e.g., race) was considered necessary or desirable.

```

The final step in the weighting process was designed to correct for the fact that the total number of cases in the weighted sample was larger than the unweighted sample size because of the use of the number of eligibles weight. In order to avoid misinterpretation of sample size, the total number of cases in the unweighted sample was divided by the total number of cases in the weighted sample to yield a sample size weight. When this weight is applied, the size of the weighted sample is identical to the size of the unweighted sample.

The final weight (WEIGHT6) incorporates all of the intermediate weighting steps described above. The final weight adjusts the total completed interviews in the achieved sample to correct for known sampling and participation biases, while maintaining the unweighted sample size.

Precision of Sample Estimates

The objective of the sampling procedures used on this study was to produce a random sample of the target population. A random sample shares the same properties and characteristics of the total population from which it is drawn, subject to a certain level of sampling error. This means that with a properly drawn sample we can make statements about the properties and characteristics of the total population within certain specified limits of certainty and sampling variability.

The confidence interval for sample estimates of population proportions, using simple random sampling without replacement, is calculated by the following formula:

$$\text{var}(x) = z \sqrt{\frac{p(q)}{n-1}}$$

Where:

$\text{var}(x)$ = the expected sampling error of the mean of some variable, expressed as a proportion

p = some proportion of the sample displaying a certain characteristic or attribute

q = $(1 - p)$

z = the standardized normal variable, given a specified confidence level (1.96 for samples of this size).

n = the size of the sample

The sample sizes for the surveys are large enough to permit estimates for subsamples of particular interest. Table 5, on the next page, presents the expected size of the sampling error for specified sample sizes of 8,000 and less, at different response distributions on a categorical variable. As the table shows, larger samples produce smaller expected sampling variances, but there is a constantly declining marginal utility of variance reduction per sample size increase.

TABLE 5
Expected Sampling Error (Plus or Minus)
At the 95% Confidence Level
(Simple Random Sample)

Size of Sample or Subsample	Percentage of the Sample or Subsample Giving A Certain Response or Displaying a Certain Characteristic for Percentages Near:

75	6.8	9.1	10.4	11.2	11.4
50	8.4	11.2	12.8	13.7	14.0

NOTE: Entries are expressed as percentage points (+ or -)

However, the sampling design for this study included a separate, concurrently administered oversample of youth and young adults (age 16-39). Both the cross-sectional sample and the oversample of the youth/younger adult population were drawn as simple random samples; however, the disproportionate sampling of the age 16-39 population introduces a design effect that makes it inappropriate to assume that the sampling error for total sample estimates will be identical to those of a simple random sample.

In order to calculate a specific interval for estimates from a sample, the appropriate statistical formula for calculating the allowance for sampling error (at a 95% confidence interval) in a stratified sample with a disproportionate design is:

$$\text{ASE} = 1.96 \sqrt{\sum_{h=1}^g [w_h^2 \{(1-f_h)(s_h^2/n_h - 1)\}]}$$

where:

ASE	=	allowance for sampling error at the 95% confidence level;
h	=	a sample stratum;
g	=	number of sample strata;
w_h	=	stratum h as a proportion of total population;
f_h	=	the sampling fraction for group h -- the number in the sample divided by the number in the universe;
s_h^2	=	the variance in the stratum h -- for proportions this is equal to $p_h(1.0 - p_h)$;
n_h	=	the sample size for the stratum h .

Although Table 5 above provides a useful approximation of the magnitude of expected sampling error, precise calculation of allowances for sampling error requires the use of this formula. To assess the design effect for sample estimates, we calculated sampling errors for the disproportionate sample for a number of key variables using the above formula. These estimates were then compared to the sampling errors for the same variables, assuming a simple random sample of the same size. The two strata (h^1 and h^2) in the disproportionate sample were all respondents age 16-39 and all respondents age 40 and over respectively. The proportion for the 16-39 year old stratum (w^1) was 45.7 percent while the proportion for the 40 and over stratum (w^2) was 54.3 percent.

As shown in Table 6 below, the disproportionate sampling increases the confidence interval by about 2 percent, compared to a simple random sample of the same size. This means that sample design introduces almost no measurable loss in sampling precision for total population estimates, while increasing the precision of sampling estimates for the target population aged 16-39 years old. Since the difference in sampling precision between the stratified disproportionate sample and a simple random sample is less than one tenth of percentage point in each case, the sampling error table for a simple random sample will provide a reasonable approximation of the precision of sampling estimates in the survey.

TABLE 6
Design Effect on Confidence Intervals for Sample Estimates
Between Disproportionate Sample Used in Occupant Protection Survey
And a Proportionate Sample of Same Size

	CONFIDENCE INTERVALS		
	PERCENTAGE POINTS \pm AT 95% CONFIDENCE LEVEL

Estimating Statistical Significance

The estimates of sampling precision presented in the previous section yield confidence bands around the sample estimates, within which the true population value should lie. This type of sampling estimate is appropriate when the goal of the research is to estimate a population distribution parameter. However, the purpose of some surveys is to provide a comparison of population parameters estimated from independent samples (e.g. annual tracking surveys) or between subsets of the same sample. In such instances, the question is not simply whether or not there is any difference in the sample statistics which estimate the population parameter, but rather is the difference between the sample estimates statistically significant (i.e., beyond the expected limits of sampling error for both sample estimates).

To test whether or not a difference between two sample proportions is statistically significant, a rather simple calculation can be made. Call the total sampling error (i.e., var (x) in the previous formula) of the first sample s_1 and the total sampling error of the second sample s_2 . Then, the sampling error of the difference between these estimates is sd which is calculated as:

$$sd = \sqrt{s_1^2 + s_2^2}$$

Any difference between observed proportions that exceeds sd is a statistically significant difference at the specified confidence interval. Note that this technique is mathematically equivalent to generating standardized tests of the difference between proportions.

An illustration of the pooled sampling error between subsamples for various sizes is presented in Table 7. This table can be used to indicate the size of difference in proportions between drivers and non-drivers or other subsamples that would be statistically significant.

TABLE 7. Pooled Sampling Error Expressed as Percentages For Given Sample Sizes (Assuming $P=Q$)

Sample Size	TABLE 7. Pooled Sampling Error Expressed as Percentages For Given Sample Sizes (Assuming P=Q)										Sample Size

Statistical Comparisons Between Samples

In order to permit statistical comparisons between the two samples, the data sets from the two separate samples were merged together on like questions. The sample versions (1 for Safety Belt Usage and 2 for Child Safety Seats) were crosstabulated with each of the survey questions which had been asked in an equivalent fashion in the two samples. A chi square test was conducted for each of these crosstabulations to test for the independence of samples.

An exact test of independence was calculated to test the differences between the two samples. Pearson's chi square is a widely used statistic to test the hypothesis that the row and column variables are independent. It is calculated by summing over all cells the squared residuals divided by the expected frequencies. The calculated chi-square is compared to the critical points of the theoretical chi-square distribution to produce an estimate of how likely (or unlikely) this calculated value is, if the two variables are in fact independent. This probability is also known as the observed significance level of the test. If the probability is small (usually less than 0.05), the hypothesis that the two variables are independent is rejected.

No statistically significant difference (at the .05 level) was found between the two samples on most demographic characteristics, including race, ethnicity (Hispanic), educational attainment, and marital status. There is no difference between samples on most vehicle characteristics (e.g., airbags, type of seatbelts) or driver behaviors (e.g., drive everyday, always wear seatbelts).

There are, nonetheless, a limited set of differences large enough to be statistically significant with samples of this size. The proportion of van/minivan drivers in Version 2 is lower (8.2%) than in Version 1 (10.8%). The proportion of primary vehicles with airbags is higher in Version 1 (53.9%) compared to Version 2 (50.6%). The proportion of those reporting they had been injured in an accident was higher in Version 2 (25.4%) than in Version 1 (22.9%); and those who said their injuries prevented them from performing activities for at least one week were higher in Version 1 (55.5%) than in Version 2 (49.8%). The reported income between the two survey versions was also found to be significantly different. All these differences are likely due to the large sample size.

Finally, although the proportion of past month drinkers is the same in the two surveys (48.8% to 47.6), the proportion who report driving after drinking in the past month is significantly lower in the Child Safety Survey (20.9%) than the Seatbelt Survey (27.3%). This last difference probably reflects a contextual effect (willingness to report drinking and driving after an intense discussion of child safety in cars) rather than sample differences.

INTRODUCTION

Hello, I'm _____ calling for the U.S. Department of Transportation. We are conducting a national study of Americans' driving habits and their attitudes about current driving laws. The interview is completely confidential.

DUMMY QUESTION FOR BIRTHDAY QUESTIONS

Has had the most recent.....1
Will have the next.....2

IF SAMPLE TYPE EQ 1, ASK A, ELSE ASK B.

In order to select just one person to interview, could I speak to the person in your household, 16 or older, who (has had the most recent/will have the next) birthday?

Respondent is the person.....	1	SKIP TO Q.1
Other respondent comes to phone.....	2	SKIP TO D
Respondent is not available.....	3	ARRANGE CALLBACK
Refused.....	4	

IF SAMPLE TYPE EQ 2 ASK B

B. Is there anyone aged 16 to 39 years old living in your household?

Yes.....1
No.....2 THANK AND SCREEN OUT

C. Could I speak to the person aged 16 to 39 years old living in your household who (has had the most recent/will have the next) birthday?

Respondent is the person.....	1	
Other respondent comes to phone.....	2	
Respondent not available.....	3	ARRANGE CALLBACK
Refused.....	4	

D. Hello, I'm calling for the U.S. Department of Transportation. We are conducting a national study of Americans' driving habits and their attitudes about current driving laws. The interview is completely confidential. It takes fifteen to twenty minutes. Could we begin now?

CONTINUE INTERVIEW.....	1	SKIP TO Q1
Arrange Callback.....	2	CALLBACK
Refused.....	3	

D1. Would you please tell me why you do not want to do the interview?

Q1. How often do you drive a motor vehicle? Almost every day, a few days a week, a few days a month, a few days a year, or do you never drive?

Almost every day.....	1	
Few days a week.....	2	
Few days a month.....	3	
Few days a year.....	4	
Never.....	5	SKIP TO Q.30
Other.....	6	
(SPECIFY)		
(VOL) Don't know.....	7	
(VOL) Refused.....	8	

Q.2 Not including driving to and from work, do you at least sometimes drive a vehicle as part of a job or business?

Yes.....	1	
No.....	2	SKIP TO Q.6
Don't work.....	3	SKIP TO Q.6
(VOL) Not sure.....	4	SKIP TO Q.6
(VOL) Refused.....	5	SKIP TO Q.6

Q.3 How often do you drive a vehicle as part of a job or business? Almost every day, a few days a week, a few days a month, or a few days a year?

Almost every day.....	1	
Few days a week.....	2	
Few days a month.....	3	
Few days a year.....	4	
(VOL) Never.....	5	
Other.....	6	
(SPECIFY)		
(VOL) Don't know.....	7	
(VOL) Refused.....	8	

Q.4 Does your company or business have a policy requiring seat belt use when driving on the job?

Yes.....	1	
No.....	2	SKIP TO Q.6
(VOL) Not sure.....	3	SKIP TO Q.6
(VOL) Refused.....	4	SKIP TO Q.6

Q.5a Is that a written policy?

Yes.....	1
No.....	2
(VOL) Not sure.....	3
(VOL) Refused.....	4

Q.5b How strictly does your company enforce its policy about wearing seatbelts? Is the policy enforced....

Very strictly.....	1
Somewhat strictly.....	2
Not too strictly.....	3
Not at all.....	4
(VOL) Not sure....	5
(VOL) Refused.....	6

SKIP TO Q6
SKIP TO Q6
SKIP TO Q6

Q.5c How does your company enforce its seatbelt policy?

Q.6 Comparing your driving to other drivers, would you say you are average, better than average or below average?

Average.....	1
Better than average.....	2
Below average.....	3
(VOL) Not sure.....	4
(VOL) Refused.....	5

Q.7 Now I'd like you to think about all the driving you do (whether or not it's part of your job). Is the vehicle you drive most often a car, van, motorcycle, sport utility vehicle, pickup truck, or other type of truck? (**NOTE: IF RESPONDENT DRIVES MORE THAN ONE VEHICLE OFTEN, ASK: "What kind of vehicle did you LAST drive?"**)

Car.....	1
Van or minivan.....	2
Motorcycle.....	3
Pickup truck.....	4
Sport utility vehicle (Jeep/Explorer/Trooper/etc).....	5
Other (specify _____).....	10
Other truck (SPECIFY _____).....	11
(VOL) Don't know.....	12
(VOL) Refused.....	13

IF Q.2=YES AND Q.3=1 OR 2, ASK Q.8, ELSE GO TO Q.9

Q.8 Do you drive this vehicle only for work, only for personal driving or for both work and personal driving?

Only for work.....	1
Only for personal use.....	2
For both work and personal driving.....	3
(VOL) Don't know.....	4
(VOL) Refused.....	5

IF Q.7=MOTORCYCLE, SKIP TO Q.30, ELSE GO TO Q.9

- Q.9 For the next series of questions, please answer only for the (car/truck/van) you said you usually drive. Do the seat belts in the front seat of the (car/truck/van) go across your shoulder only, across your lap only, or across both your shoulder and lap?

INTERVIEWER INSTRUCTION: SEATBELT QUESTIONS REFER TO DRIVER-SIDE BELTS.

Across shoulder.....	1	SKIP TO Q.12
Across lap.....	2	SKIP TO Q.15
Across both.....	3	
Vehicle has no belts.....	4	SKIP TO Q.30
(VOL) Don't know.....	5	SKIP TO Q.16a
(VOL) Refused.....	6	SKIP TO Q.16a

- Q.10 Are the shoulder and lap belt one piece or are they two separate belts?

One piece.....	1	SKIP TO Q.12
Two separate belts.....	2	
(VOL) Don't know.....	3	
(VOL) Refused.....	4	

- Q.11 Are both the shoulder and lap belt automatic, is only the shoulder belt automatic or is neither the shoulder or lap belt automatic?

Both are automatic.....	1	SKIP TO Q.13a
Only shoulder is automatic.....	2	SKIP TO Q.13a
Neither are automatic.....	3	SKIP TO Q.13b
(VOL) Don't know.....	4	SKIP TO Q.13b
(VOL) Refused.....	5	SKIP TO Q.13b

- Q.12 Is the shoulder belt automatic or do you have to fasten it?

Automatic.....	1	
Manual.....	2	SKIP TO Q.13b
(VOL) Don't know.....	3	SKIP TO Q.13b
(VOL) Refused.....	4	SKIP TO Q.13b

- Q.13a When you drive, do you always wear your automatic belt or is it ever disconnected, disabled, or placed behind you?

Always wear it.....	1	
Disconnected.....	2	
Disabled.....	3	
Placed behind me.....	4	

- Q.13b Shoulder belts are usually attached to the door or frame behind the driver's left shoulder. In some vehicles, this attachment can be moved up or down to adjust the shoulder belt. Is this attachment adjustable in your vehicle?

Yes, adjustable.....	1	
No, not adjustable.....	2	SKIP TO Q14
Not sure.....	3	SKIP TO Q14

Q.13c Have you ever tried to adjust it?

Yes.....1
No.....2 SKIP TO Q14

Q.13d Were you able to make the shoulder belt more comfortable by adjusting it?

Yes.....1
No2
(VOL) Could not adjust it...3

IF Q9=1 OR 3 ASK Q14, ELSE GO TO Q15

Q.14 When driving this (car/truck/van), how often do you wear your shoulder belt... (READ LIST)

ALL OF THE TIME.....1
MOST OF THE TIME.....2
SOME OF THE TIME.....3
RARELY OR.....4
NEVER.....5
(VOL) Don't know.....6

IF Q9=2 OR 3 ASK Q15, ELSE GO TO Q16a

Q.67b Otra respuesta a lo que significa “EMS”

IF GAVE WRONG ANSWER ON Q.67a READ THIS STATEMENT, ELSE GO TO Q.68a

Bastante gente no lo sabe, pero EMS significa Servicios Medicales de Emergencia. Esto incluye escuadrones de ambulancias y rescates y servicios hospitalares de emergencias.

Q.68a ¿ Si alguien estuviera sufriendo una emergencia medical y usted tuviera que obtener ayuda para esa persona, a quién llamaría usted primero? **NOTA:** Emergencia medicinal quiere decir una situación donde su vide esté en peligro.
